**(54) OPTICAL DISK AND INFORMATION RECORDER**

(57) Abstract:

**PROBLEM TO BE SOLVED:** To provide an optical disk capable of performing a timing control with excellent jitter, keeping a recording positional precision high and increasing the recording capacity without providing futile buffer area, and to provide an information recorder.

**SOLUTION:** Groove tracks G and adjacent land tracks L are spirally and alternately formed on the optical disk 1, the groove track G is subjected to a wobbling processing, and gap parts GP are arranged at every prescribed interval on the groove track G. This interval is defined as N times (N is natural number) of a period of a SYNC pattern inserted at a recording time, and the length L<sub>g</sub> of the gap part GP is made shortened than the length of the SYNC pattern. Thus, the gap part GP is detected to perform the

timing control, thereby recording the recording data with the high positional precision.
